

Isometric projection

Isometric projection is a drawing technique which looks fairly realistic and is commonly used to represent 3D objects. The main advantage is that you can draw a 3D object to scale. Remember to only draw at 30° or 90° and you won't go wrong!

You will now learn how to draw a '3D cube' to scale in isometric view. You will need isometric paper or a 60° set square!

Now draw a light baseline at 90° then draw a light height line also at 90° and 50mm high. Now draw a heavy line over the light line at 25mm and at 90° .

Step 1

From the two ends of your centre line draw four parallel lines at 25mm out at 30° . Note: Use the 30° line on your set square!

Step 2

Now add the two sides of your cube at 90° and at 25mm high like below.

Step 3

From the top right hand corner draw a heavy line to the top of your 50mm light guideline at 30° .

Step 4

Now join your final line at 30° to close your cube. You have now finished, well done!

Step 5
